FLIGHT FINDER APP

INTRODUCTION

Introducing MD Flights, the ultimate digital platform designed to revolutionize the way you book flight tickets. With MD Flights, your flight travel experience will be elevated to new heights of convenience and efficiency.

Our user-friendly web app empowers travelers to effortlessly discover, explore, and reserve flight tickets based on their unique preferences. Whether you're a frequent commuter or an occasional traveler, finding the perfect flight journey has never been easier.

Imagine accessing comprehensive details about each flight journey at your fingertips. From departure and arrival times to flight classes and available amenities, you'll have all the information you need to make informed decisions. No more guessing or uncertainty – MD Flights ensures that every aspect of your flight travel is crystal clear.

The booking process is a breeze. Simply provide your name, age, and preferred travel dates, along with the departure and arrival cities, and the number of passengers. Once you submit your booking request, you'll receive an instant confirmation of your ticket reservation. No more waiting in long queues or dealing with complicated reservation systems – MD Flights makes it quick and hassle-free.

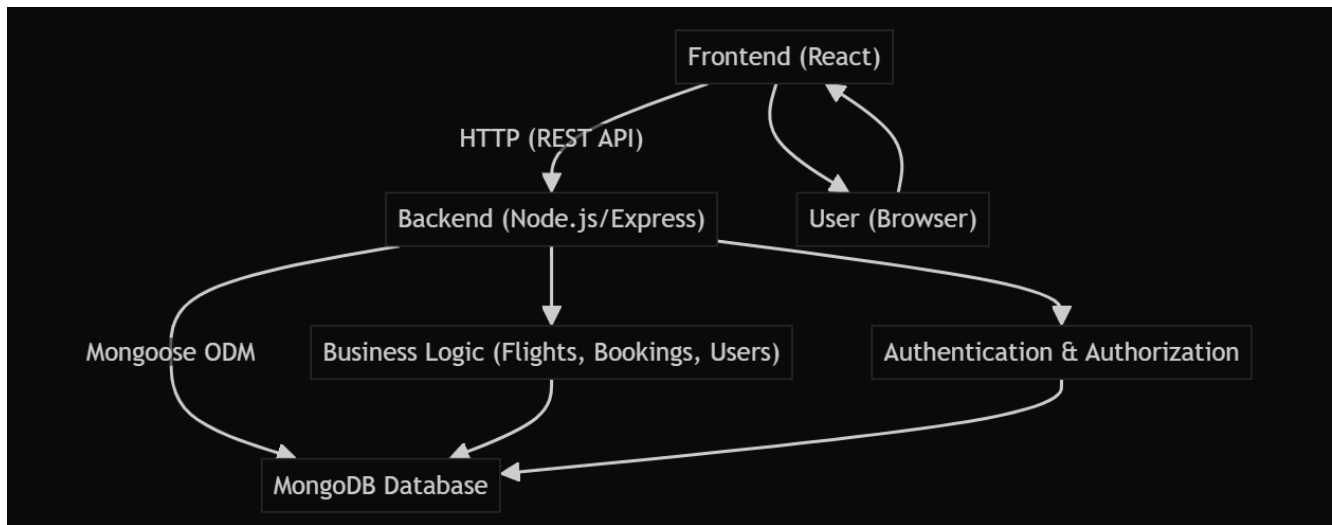

Once your booking is confirmed, our dedicated booking details page becomes your travel companion. It provides a comprehensive overview of your current and previous bookings, allowing you to effortlessly manage your travel plans and stay organized. With MD Flights, you'll have all your essential travel information at your fingertips, ensuring a stress-free journey.

But MD Flights isn't just for travelers. Flight administrators also benefit from our intuitive admin dashboard. This specially designed dashboard empowers administrators to efficiently manage and oversee ticket reservations for their flight service. They can easily view the list of available flights for booking and monitor the bookings made by users. With separate login and registration pages for each flight service, privacy and security are always maintained.

MD Flights is here to enhance your travel experience by providing a seamless and convenient way to book flight tickets. With our user-friendly interface, efficient booking management, and robust administrative features, we ensure a hassle-free and enjoyable flight ticket booking experience for both users and flight administrators alike.

Get ready to embark on a new era of flight travel with MD Flights – your ticket to effortless booking and unforgettable journeys.

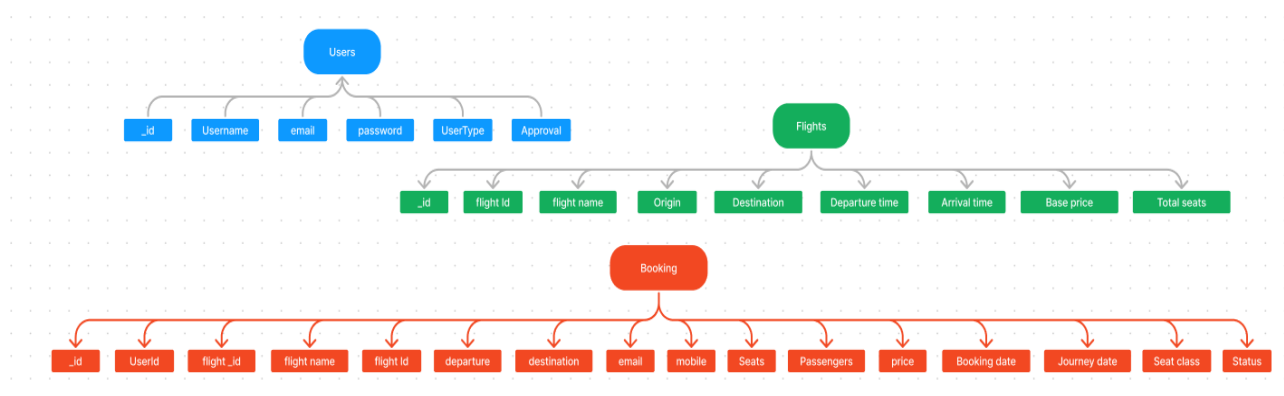

TECHNICAL ARCHITECTURE:

In this architecture diagram:

- The frontend is represented by the "Frontend" section, including user interface components such as User Authentication, Flight Search, and Booking.
- The backend is represented by the "Backend" section, consisting of API endpoints for Users, Flights, Admin and Bookings. It also includes Admin Authentication and an Admin Dashboard.
- The Database section represents the database that stores collections for Users, Flights, and Flight Bookings.

ER DIAGRAM:

The flight finder ER-diagram represents the entities and relationships involved in a flight booking system. It illustrates how users, bookings, flights, passengers, and payments are interconnected. Here is a breakdown of the entities and their relationships:

USER: Represents the individuals or entities who book flights. A customer can place multiple bookings and make multiple payments.

BOOKING: Represents a specific flight booking made by a customer. A booking includes a particular flight details and passenger information. A customer can have multiple bookings.

FLIGHT: Represents a flight that is available for booking. Here, the details of flight will be provided and the users can book them as much as the available seats.

ADMIN: Admin is responsible for all the backend activities. Admin manages all the bookings, adds new flights, etc.,

Features:

1. **Extensive Flight Listing:** MD Flights offers an extensive list of flight services, providing a wide range of routes and options for travelers. You can easily browse through the list and explore different flight journeys, including departure and arrival times, flight classes, and available amenities, to find the perfect travel option for your journey.
2. **Book Now Button:** Each flight listing includes a convenient "Book Now" button. When you find a flight journey that suits your preferences, simply click on the button to proceed with the reservation process.
3. **Booking Details:** Upon clicking the "Book Now" button, you will be directed to a booking details page. Here, you can provide relevant information such as your preferred travel dates, departure and arrival stations, the number of passengers, and any special requirements you may have.
4. **Secure and Efficient Booking Process:** MD Flights ensures a secure and efficient booking process. Your personal information will be handled with the utmost care, and we strive to make the reservation process as quick and hassle-free as possible.
5. **Confirmation and Booking Details Page:** Once you have successfully made a reservation, you will receive a confirmation message. You will then be redirected to a booking details page, where you can review all the relevant information about your booking, including your travel dates, departure and arrival stations, the number of passengers, and any special requirements you specified.

In addition to these user-facing features, MD Flights provides a powerful admin dashboard, offering administrators a range of functionalities to efficiently manage the system. With the admin dashboard, admins can add and manage multiple flight services, view the list of available flights, monitor user activity, and access booking details for all flight journeys.

MD Flights is designed to enhance your flight travel experience by providing a seamless and user- friendly way to book flight tickets. With our efficient booking process, extensive flight listings, and robust admin dashboard, we ensure a convenient and hassle-free flight ticket booking experience for both users and flight administrators alike.

PREREQUISITES:

To develop a full-stack flight booking app using React JS, Node.js, and MongoDB, there are several prerequisites you should consider. Here are the key prerequisites for developing such an application:

Node.js and npm: Install Node.js, which includes npm (Node Package Manager), on your development machine. Node.js is required to run JavaScript on the server side.

- Download: <https://nodejs.org/en/download/>
- Installation instructions: <https://nodejs.org/en/download/package-manager/>

MongoDB: Set up a MongoDB database to store hotel and booking information. Install MongoDB locally or use a cloud-based MongoDB service.

- Download: <https://www.mongodb.com/try/download/community>
- Installation instructions: <https://docs.mongodb.com/manual/installation/>

Express.js: Express.js is a web application framework for Node.js. Install Express.js to handle server-side routing, middleware, and API development.

- Installation: Open your command prompt or terminal and run the following command: **npm install express**

React.js: React.js is a popular JavaScript library for building user interfaces. It enables developers to create interactive and reusable UI components, making it easier to build dynamic and responsive web applications. To install React.js, a JavaScript library for building user interfaces, follow the installation guide: <https://reactjs.org/docs/create-a-new-react-app.html>

HTML, CSS, and JavaScript: Basic knowledge of HTML for creating the structure of your app, CSS for styling, and JavaScript for client-side interactivity is essential.

Database Connectivity: Use a MongoDB driver or an Object-Document Mapping (ODM) library like Mongoose to connect your Node.js server with the MongoDB database and perform CRUD (Create, Read, Update, Delete) operations.

Front-end Framework: Utilize Angular to build the user-facing part of the application, including products listings, booking forms, and user interfaces for the admin dashboard.

Version Control: Use Git for version control, enabling collaboration and tracking changes throughout the development process. Platforms like GitHub or Bitbucket can host your repository.

- Git: Download and installation instructions can be found at: <https://git-scm.com/downloads>

Development Environment: Choose a code editor or Integrated Development Environment (IDE) that suits your preferences, such as Visual Studio Code, Sublime Text, or WebStorm.

- Visual Studio Code: Download from <https://code.visualstudio.com/download>
- Sublime Text: Download from <https://www.sublimetext.com/download>
- WebStorm: Download from <https://www.jetbrains.com/webstorm/download>

To Connect the Database with Node JS go through the below provided link:

- Link: <https://www.section.io/engineering-education/nodejs-mongoosejs-mongodb/>

To run the existing Flight Booking App project downloaded from github:

Follow below steps:

Clone the repository:

- Open your terminal or command prompt.
- Navigate to the directory where you want to store the e-commerce app.
- Execute the following command to clone the repository:

Git clone:

`https://github.com/MohdAliAkmalBaig/flight-finder`

Install Dependencies:

- Navigate into the cloned repository directory:
cd Flight-Booking-App-MERN
- Install the required dependencies by running the following command:
npm install

Start the Development Server:

- To start the development server, execute the following command:
npm run dev or npm start
- The e-commerce app will be accessible at `http://localhost:3000` by default. You can change the port configuration in the `.env` file if needed.

Access the App:

- Open your web browser and navigate to `http://localhost:3000`.
- You should see the flight booking app's homepage, indicating that the installation and setup were successful.

You have successfully installed and set up the flight booking app on your local machine. You can now proceed with further customization, development, and testing as needed.

USER & ADMIN FLOW:

1. User Flow:

- Users start by registering for an account.
- After registration, they can log in with their credentials.
- Once logged in, they can check for the availability of flights in their desired route and dates.
- Users can select a specific flight from the list.
- They can then proceed by entering passenger details and other required data.
- After booking, they can view the details of their booking.

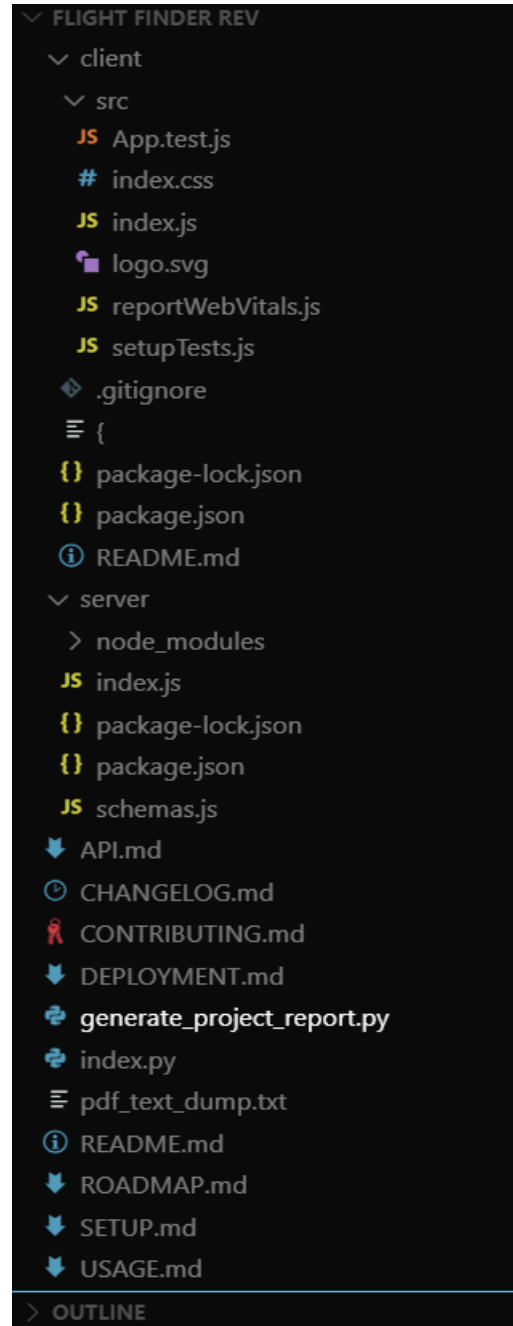

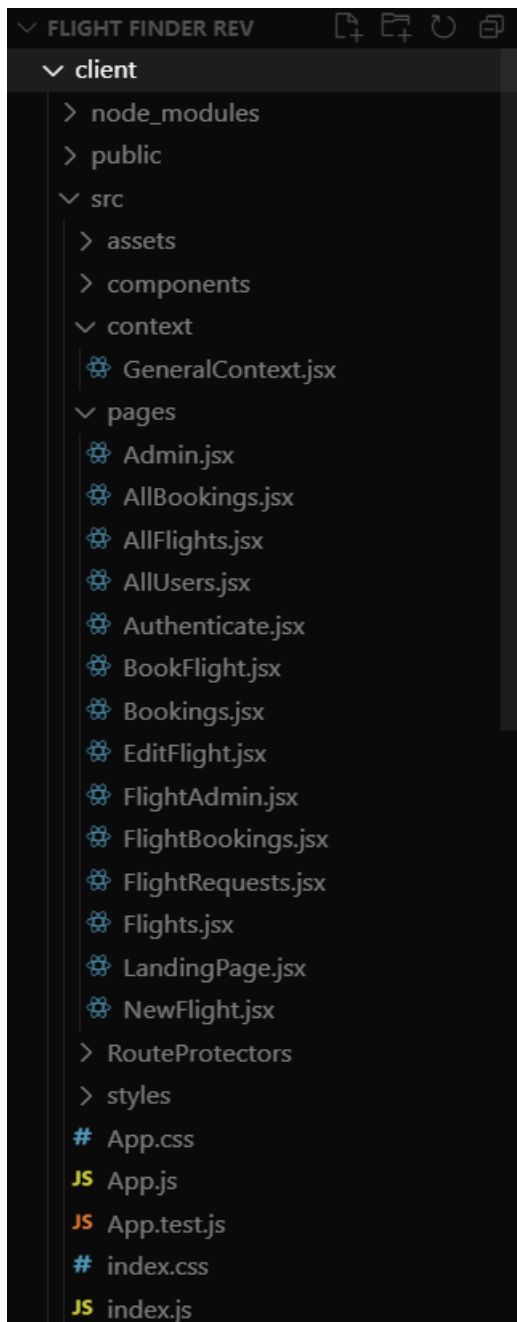

2. Flight Operator Flow:

- Flight operator start by logging in with their credentials.
- Once logged in, they are directed to the Flight operator Dashboard.
- Flight Operator can access the Dashboard, where they can view bookings, add new flight routes, etc.,

3. Admin Flow:

- Admins start by logging in with their credentials.
- Once logged in, they are directed to the Admin Dashboard.
- Admins can access the Flight Booking Admin Dashboard, where they can view bookings, approve new flight operators, etc.,

PROJECT STRUCTURE:

This structure assumes a React app and follows a modular approach. Here's a brief explanation of the main directories and files:

- `src/components`: Contains components related to the application such as, `register`, `login`, `home`, `bookings`, etc..
- `src/pages` has the files for all the pages in the application.

Project Flow:

Benchmark 1: Project Setup and Configuration:

1. Install required tools and software:

- Node.js.
- MongoDB.
- React Js.
- Git.

2. Create project folders and files:

- Client folders.
- Server folders

Benchmark 2: Backend Development:

1. Setup express server:

- Install express.
- Create index.js file.

2. Configure MongoDB:

- Install Mongoose.
- Create database connection.

3. Implement API end points:

- Implement CRUD operations.
- Test API endpoints.

Benchmark 3: Web Development:

1. Setup React Application:

- Create React app in client folder.
- Install required libraries
- Create required pages and components and add routes.

2. Design UI components:

- Create Components.
- Implement layout and styling.
- Add navigation.

3. Implement frontend logic:

- Integration with API endpoints.
- Implement data binding.

Backend:

1. Set Up Project Structure:

- Create a new directory for your project and set up a package.json file using npm init command.
- Install necessary dependencies such as Express.js, Mongoose, and other required packages.

2. Database Configuration:

- Set up a MongoDB database either locally or using a cloud-based MongoDB service like MongoDB Atlas or use locally with MongoDB compass.
- Create a database and define the necessary collections for flights, users, bookings, and other relevant data.

3. Create Express.js Server:

- Set up an Express.js server to handle HTTP requests and serve API endpoints.
- Configure middleware such as body-parser for parsing request bodies and cors for handling cross-origin requests.

4. Define API Routes:

- Create separate route files for different API functionalities such as flights, users, bookings, and authentication.
- Define the necessary routes for listing flights, handling user registration and login, managing bookings, etc.
- Implement route handlers using Express.js to handle requests and interact with the database.

5. Implement Data Models:

- Define Mongoose schemas for the different data entities like flights, users, and bookings.
- Create corresponding Mongoose models to interact with the MongoDB database.
- Implement CRUD operations (Create, Read, Update, Delete) for each model to perform database operations.
-

6. User Authentication:

- Create routes and middleware for user registration, login, and logout.
- Set up authentication middleware to protect routes that require user authentication.

7. Handle new Flights and Bookings:

- Create routes and controllers to handle new flight listings, including fetching flight data from the database and sending it as a response.
- Implement booking functionality by creating routes and controllers to handle booking requests, including validation and database updates.

8. Admin Functionality:

- Implement routes and controllers specific to admin functionalities such as adding flights, managing user bookings, etc.
- Add necessary authentication and authorization checks to ensure only authorized admins can access these routes.

9. Error Handling:

- Implement error handling middleware to catch and handle any errors that occur during the API requests.
- Return appropriate error responses with relevant error messages and HTTP status codes.

Schema use case:

1. User Schema:

- Schema: userSchema
- Model: 'User'
- The User schema represents the user data and includes fields such as username, email, and password.
- It is used to store user information for registration and authentication purposes.
- The email field is marked as unique to ensure that each user has a unique email address.

2. Flight Schema:

- Schema: flightSchema
- Model: 'Flight'
- The Flight schema represents the hotel data and includes fields such as Flight Name, Flight Id, Origin, Destination, Price, seats, etc.,
- It is used to store information about flights available for bookings.

3. Booking Schema:

- Schema: BookingsSchema
- Model: 'Booking'
- The Booking schema represents the booking data and includes fields such as userId, flight Name, flight Id, Passengers, Coach Class, Journey Date, etc.,
- It is used to store information about the flight bookings made by users.
- The user Id field is a reference to the user who made the booking.

Code Explanation

Server setup:

Let us import all the required tools/libraries and connect the database.

Make sure to import all the required libraries or tools.

Make a valid connection with the database.

```
server > JS index.js > ...
1 import express from 'express';
2 import bodyParser from 'body-parser';
3 import mongoose from 'mongoose';
4 import cors from 'cors';
5 import bcrypt from 'bcrypt';
6 import { User, Booking, Flight } from './schemas.js';
7
8 const app = express();
9
10 app.use(express.json());
11 app.use(bodyParser.json({limit: "30mb", extended: true}));
12 app.use(bodyParser.urlencoded({limit: "30mb", extended: true}));
13 app.use(cors());
14
15 // mongoose setup
16
17 const PORT = 6002;
18 mongoose.connect('mongodb://localhost:27017/FlightBookingMERN', {
19   useNewUrlParser: true,
20   useUnifiedTopology: true,
21 })
22 ).then(()=>{
23
24   // All the client-server activities
25
26
27   app.post('/register', async (req, res) => {
28     const { username, email, usertype, password } = req.body;
29     let approval = 'approved';
30     try {
31
32       const existingUser = await User.findOne({ email });
33       if (existingUser) {
34         return res.status(400).json({ message: 'User already exists' });
35       }
36     }
```

Schemas:

Now let us define the required schemas

Create the schemas for :

- User
- Flights
- Bookings

```
server > JS schemas.js > ...
```

```
1  import mongoose from "mongoose";
2
3  const userSchema = new mongoose.Schema({
4    username: { type: String, required: true },
5    email: { type: String, required: true, unique: true },
6    usertype: { type: String, required: true },
7    password: { type: String, required: true },
8    approval: { type: String, default: 'approved' }
9  });
10 const flightSchema = new mongoose.Schema({
11   flightName: { type: String, required: true },
12   flightId: { type: String, required: true },
13   origin: { type: String, required: true },
14   destination: { type: String, required: true },
15   departureTime: { type: String, required: true },
16   arrivalTime: { type: String, required: true },
17   basePrice: { type: Number, required: true },
18   totalSeats: { type: Number, required: true }
19 });
20 const bookingSchema = new mongoose.Schema({
21   user: { type: mongoose.Schema.Types.ObjectId, ref: 'User', required: true },
22   flight: { type: mongoose.Schema.Types.ObjectId, ref: 'Flight', required: true },
23   flightName: { type: String, required: true },
24   flightId: { type: String },
25   departure: { type: String },
26   destination: { type: String },
27   email: { type: String },
28   mobile: { type: String },
29   seats: { type: String },
30   passengers: [{
31     name: { type: String },
32     age: { type: Number }
33   }],
34   totalPrice: { type: Number },
35   bookingDate: { type: Date, default: Date.now },
36   journeyDate: { type: Date },
37   journeyTime: { type: String },
38   seatClass: { type: String },
39   bookingStatus: { type: String, default: "confirmed" }
40 });
41
42 export const User = mongoose.model('users', userSchema);
43 export const Flight = mongoose.model('Flight', flightSchema);
44 export const Booking = mongoose.model('Booking', bookingSchema);
```

User Authentication:

- Backend

Now, here we define the functions to handle http requests from the client for authentication.

```
server > JS index.js > then() callback > app.post('/register') callback
22 > ).then(()=>{
23
24 >   app.post('/register', async (req, res) => {
25     const { username, email, usertype, password } = req.body;
26     let approval = 'approved';
27 >     try {
28
29       const existingUser = await User.findOne({ email });
30 >       if (existingUser) {
31         |   return res.status(400).json({ message: 'User already exists' });
32       }
33
34 >       if(usertype === 'flight-operator'){
35         |   approval = 'not-approved'
36       }
37
38       const hashedPassword = await bcrypt.hash(password, 10);
39 >       const newUser = new User({
40         |   username, email, usertype, password: hashedPassword, approval
41       });
42       const userCreated = await newUser.save();
43       return res.status(201).json(userCreated);
44
45 >     } catch (error) {
46       |   console.log(error);
47     }
48     return res.status(500).json({ message: 'Server Error' });
49   });
50
51 >   app.post('/login', async (req, res) => {
52     const { email, password } = req.body;
53 >     try {
54
55       const user = await User.findOne({ email });
56
57 >       if (!user) {
58         |   return res.status(401).json({ message: 'Invalid email or password' });
59       }
60       const isMatch = await bcrypt.compare(password, user.password);
61 >       if (!isMatch) {
62         |   return res.status(401).json({ message: 'Invalid email or password' });
63       } else{
64         |   return res.json(user);
65       }
66     } catch (error) {
67       |   console.log(error);
68     }
69     return res.status(500).json({ message: 'Server Error' });
70   });
71
72 > });
```

- **Frontend**

The frontend contains the three sections of progress:

- Login
- Register
- Logout

Login:

The login section contains the required parameters of login namely by the

1. userId
2. username
3. email
4. password

```
AllUsers.jsx EditFlight.jsx AllFlights.jsx GeneralContext.jsx X generate_project_report.py
client > src > context > GeneralContext.jsx > GeneralContextProvider > login > then() callback
7  const GeneralContextProvider = ({children}) => {
20
21  const login = async () =>{
22    try{
23      const loginInputs = {email, password}
24      await axios.post('http://localhost:6002/login', loginInputs)
25      .then( async (res)=>{
26
27        localStorage.setItem('userId', res.data._id);
28        localStorage.setItem('userType', res.data.usertype);
29        localStorage.setItem('username', res.data.username);
30        localStorage.setItem('email', res.data.email);
31
32        if(res.data.usertype === 'customer'){
33          navigate('/');
34        } else if(res.data.usertype === 'admin'){
35          navigate('/admin');
36        } else if(res.data.usertype === 'flight-operator'){
37          navigate('/flight-admin');
38        }
39      }).catch((err) =>{
40        alert("login failed!!");
41        console.log(err);
42      });
43
44    }catch(err){
45      console.log(err);
46    }
47  }
```

Register:

```
const register = async () =>{
  try{
    await axios.post('http://localhost:6002/register', inputs)
    .then( async (res)=>{
      localStorage.setItem('userId', res.data._id);
      localStorage.setItem('userType', res.data.usertype);
      localStorage.setItem('username', res.data.username);
      localStorage.setItem('email', res.data.email);

      if(res.data.usertype === 'customer'){
        navigate('/');
      } else if(res.data.usertype === 'admin'){
        navigate('/admin');
      } else if(res.data.usertype === 'flight-operator'){
        navigate('/flight-admin');
      }

    }).catch((err) =>{
      alert("registration failed!!");
      console.log(err);
    });
  }catch(err){
    console.log(err);
  }
}
```

Logout:

```
const logout = async () =>{

  localStorage.clear();
  for (let key in localStorage) {
    if (localStorage.hasOwnProperty(key)) {
      localStorage.removeItem(key);
    }
  }

  navigate('/');
}
```

Flight Booking (User):

- Frontend

In the frontend, we implemented all the booking code in a modal. Initially, we need to implement flight searching feature with inputs of Departure city, Destination, etc.,

Flight Searching code:

With the given inputs, we need to fetch the available flights. With each flight, we add a button to book the flight, which re-directs to the flight-Booking page.

```
const LandingPage = () => {  
  const fetchFlights = async () =>{  
    if(checkBox){  
      if(departure !== "" && destination !== "" && departureDate && returnDate){  
        const date = new Date();  
        const date1 = new Date(departureDate);  
        const date2 = new Date(returnDate);  
        if(date1 > date && date2 > date1){  
          setError("");  
          await axios.get('http://localhost:6002/fetch-flights').then(  
            (response)=>{  
              setFlights(response.data);  
              console.log(response.data)  
            }  
          )  
        } else{ setError("Please check the dates"); }  
      } else{ setError("Please fill all the inputs"); }  
    }else{  
      if(departure !== "" && destination !== "" && departureDate){  
        const date = new Date();  
        const date1 = new Date(departureDate);  
        if(date1 >= date){  
          setError("");  
          await axios.get('http://localhost:6002/fetch-flights').then(  
            (response)=>{  
              setFlights(response.data);  
              console.log(response.data)  
            }  
          )  
        } else{ setError("Please check the dates"); }  
      } else{ setError("Please fill all the inputs"); }  
    }  
  }  
  const {setTicketBookingDate} = useContext(GeneralContext);  
  const userId = localStorage.getItem('userId');
```

On selecting the suitable flight, we then re-direct to the flight-booking page.

```
const handleTicketBooking = async (id, origin, destination) =>{  
  if(userId){  
    if(origin === departure){  
      setTicketBookingDate(departureDate);  
      navigate(`/book-flight/${id}`);  
    } else if(destination === departure){  
      setTicketBookingDate(returnDate);  
      navigate(`/book-flight/${id}`);  
    }  
  }else{  
    navigate('/auth');  
  }  
}
```

- Backend

In the backend, we fetch all the flights and then filter them in the client side.

```
app.get('/fetch-flights', async (req, res)=>{  
  try{  
    const flights = await Flight.find();  
    res.json(flights);  
  }catch(err){  
    console.log(err);  
  }  
})
```

Then, on confirmation, we book the flight ticket with the entered details.

```
app.post('/book-ticket', async (req, res)=>{  
  const {user, flight, flightName, flightId, departure, destination,  
    email, mobile, passengers, totalPrice, journeyDate, journeyTime, seatClass} = req.body;  
  try{  
    const bookings = await Booking.find({flight: flight, journeyDate: journeyDate, seatClass: seatClass});  
    const numBookedSeats = bookings.reduce((acc, booking) => acc + booking.passengers.length, 0);  
  
    let seats = "";  
    const seatCode = {'economy': 'E', 'premium-economy': 'P', 'business': 'B', 'first-class': 'A'};  
    let coach = seatCode[seatClass];  
    for(let i = numBookedSeats + 1; i < numBookedSeats + passengers.length+1; i++){  
      if(seats === ""){  
        seats = seats.concat(coach, '-', i);  
      }else{  
        seats = seats.concat(", ", coach, '-', i);  
      }  
    }  
    const booking = new Booking({user, flight, flightName, flightId, departure, destination,  
      email, mobile, passengers, totalPrice, journeyDate, journeyTime, seatClass, seats});  
    await booking.save();  
  
    res.json({message: 'Booking successful!!'});  
  }catch(err){  
    console.log(err);  
  }  
})
```

Fetching user bookings:

- **Frontend**

In the bookings page, along with displaying the past bookings, we will also provide an option to cancel that booking.

```
const Bookings = () => {  
  
  const [bookings, setBookings] = useState([]);  
  
  const userId = localStorage.getItem('userId');  
  
  useEffect(()=>{  
    fetchBookings();  
  }, [])  
  
  const fetchBookings = async () =>{  
    await axios.get('http://localhost:6002/fetch-bookings').then(  
      (response)=>{  
        setBookings(response.data.reverse());  
      }  
    )  
  }  
  
  const cancelTicket = async (id) =>{  
    await axios.put(`http://localhost:6002/cancel-ticket/${id}`).then(  
      (response)=>{  
        alert("Ticket cancelled!!");  
        fetchBookings();  
      }  
    )  
  }  
}
```

- **Backend**

In the backend, we fetch all the bookings and then filter for the user. Otherwise, we can fetch bookings only for the user.

```
app.get('/fetch-bookings', async (req, res)=>{  
  
  try{  
    const bookings = await Booking.find();  
    res.json(bookings);  
  }catch(err){  
    console.log(err);  
  }  
})
```

Then we define a function to delete the booking on cancelling it on client side.

```
app.put('/cancel-ticket/:id', async (req, res)=>{  
  const id = await req.params.id;  
  try{  
    const booking = await Booking.findById(req.params.id);  
    booking.bookingStatus = 'cancelled';  
    await booking.save();  
    res.json({message: "booking cancelled"});  
  }catch(err){  
    console.log(err);  
  }  
})
```

Add new flight:

Now, in the admin dashboard, we provide a functionality to add new flight.

- **Frontend**

We create a html form with required inputs for the new flight and then send an http request to the server to add it to database.

```
const [flightName, setFlightName] = useState(localStorage.getItem('username'));
const [flightId, setFlightId] = useState('');
const [origin, setOrigin] = useState('');
const [destination, setDestination] = useState('');
const [startTime, setStartTime] = useState('');
const [arrivalTime, setArrivalTime] = useState('');
const [totalSeats, setTotalSeats] = useState(0);
const [basePrice, setBasePrice] = useState(0);
const handleSubmit = async () =>{

  // validate required fields
  if (!flightId || !origin || !destination || !startTime || !arrivalTime || !totalSeats || !basePrice) {
    alert('Please fill all required fields');
    return;
  }
  const inputs = {flightName, flightId, origin, destination,
    departureTime: startTime, arrivalTime, basePrice, totalSeats};

  try {
    await axios.post('http://localhost:6002/add-flight', inputs).then(
      async (response)=>{
        alert('Flight added successfully!!');
        setFlightName('');
        setFlightId('');
        setOrigin('');
        setStartTime('');
        setArrivalTime('');
        setDestination('');
        setBasePrice(0);
        setTotalSeats(0);
      }
    )
  } catch (error) {
    alert('Failed to add flight: ' + (error.response?.data?.message || error.message));
  }
}
```

- **Backend**

In the backend, on receiving the request from the client, we then add the request body to the flight schema.

```
app.post('/add-flight', async (req, res)=>{
  const {flightName, flightId, origin, destination, departureTime,
    arrivalTime, basePrice, totalSeats} = req.body;
  try{
    const flight = new Flight({flightName, flightId, origin, destination,
      departureTime, arrivalTime, basePrice, totalSeats});
    const newFlight = await flight.save();

    res.json({message: 'flight added'});
  }catch(err){
    console.log(err);
    res.status(400).json({message: 'Validation failed', error: err.message});
  }
})
```

Update Flight:

Here, in the admin dashboard, we will update the flight details in case if we want to make any edits to it

- **Frontend:**

```
✓ const EditFlight = () => {  
  const [flightName, setFlightName] = useState('');  
  const [flightId, setFlightId] = useState('');  
  const [origin, setOrigin] = useState('');  
  const [destination, setDestination] = useState('');  
  const [startTime, setStartTime] = useState();  
  const [arrivalTime, setArrivalTime] = useState();  
  const [totalSeats, setTotalSeats] = useState(0);  
  const [basePrice, setBasePrice] = useState(0);  
  
  const {id} = useParams();  
  
  ✓ useEffect(()=>{  
    console.log(startTime);  
  }, [startTime])  
  
  ✓ useEffect(()=>{  
    fetchFlightData();  
  }, [])  
  
  ✓ const fetchFlightData = async () =>{  
  ✓   await axios.get(`http://localhost:6001/fetch-flight/${id}`).then(  
  ✓     (response) =>{  
        console.log(response.data);  
        setFlightName(response.data.flightName);  
        setFlightId(response.data.flightId);  
        setOrigin(response.data.origin);  
        setDestination(response.data.destination);  
        setTotalSeats(response.data.totalSeats);  
        setBasePrice(response.data.basePrice);  
      }  
    )  
  }  
}
```

- **Backend:**

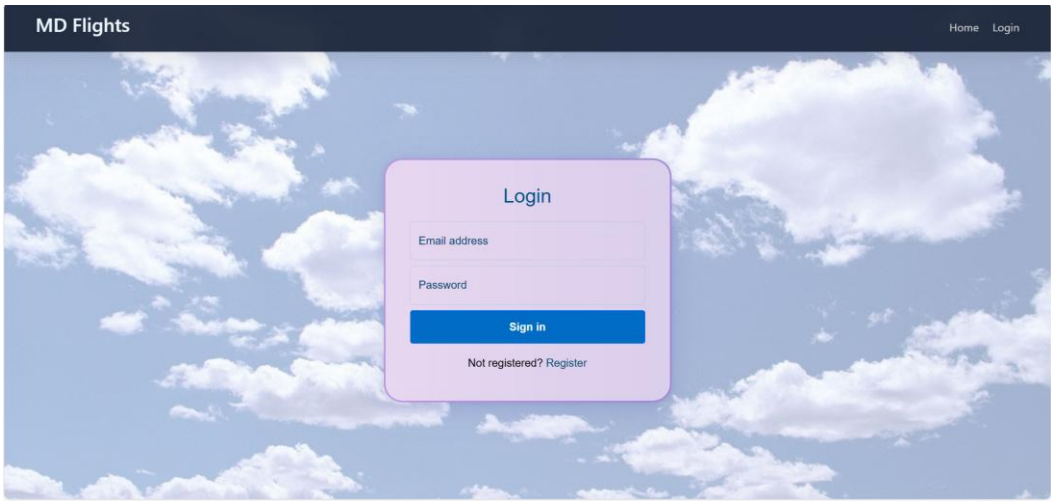

```
app.put('/update-flight', async (req, res)=>{  
  const {_id, flightName, flightId, origin, destination,  
    departureTime, arrivalTime, basePrice, totalSeats} = req.body;  
  try{  
    const flight = await Flight.findById(_id)  
  
    flight.flightName = flightName;  
    flight.flightId = flightId;  
    flight.origin = origin;  
    flight.destination = destination;  
    flight.departureTime = departureTime;  
    flight.arrivalTime = arrivalTime;  
    flight.basePrice = basePrice;  
    flight.totalSeats = totalSeats;  
  
    const newFlight = await flight.save();  
    -----  
    res.json({message: 'flight updated'});  
  }catch(err){  
    console.log(err);  
    res.status(400).json({message: 'Update failed', error: err.message});  
  }  
})
```

Demo UI images:

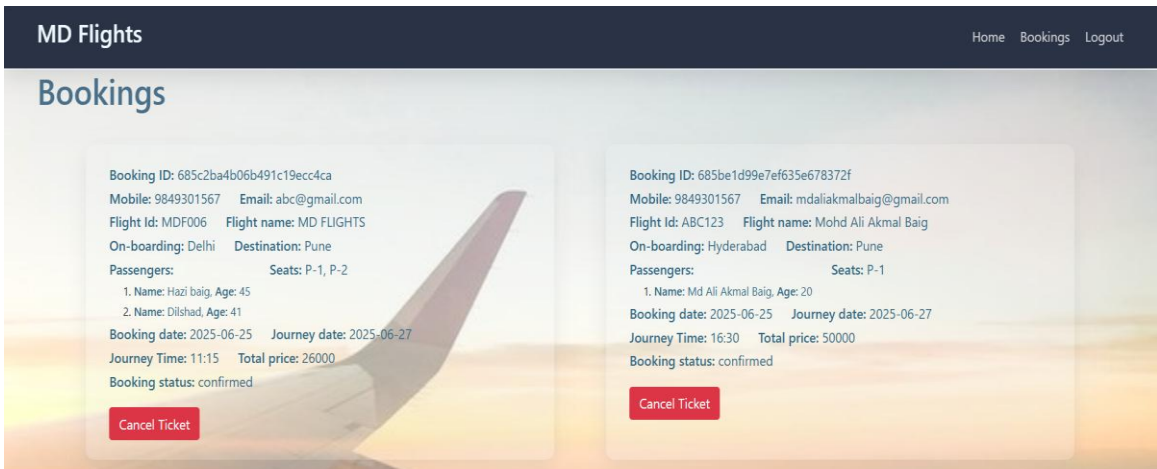

- Landing page

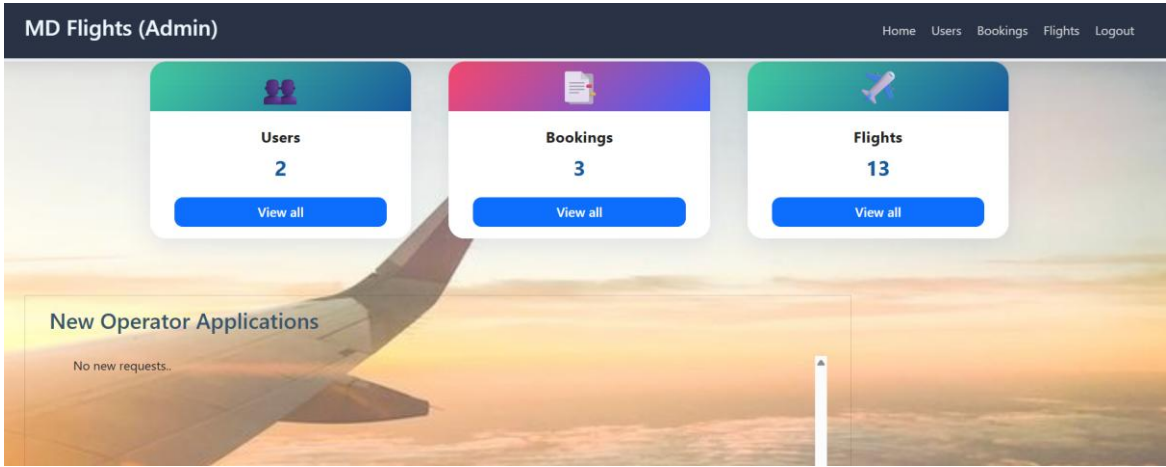

- Authentication

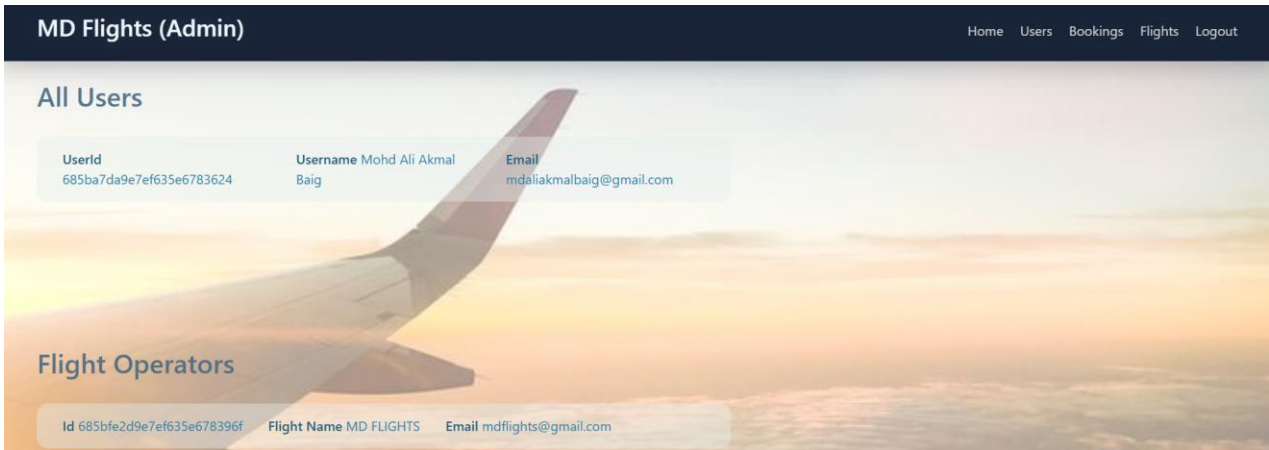

- User bookings

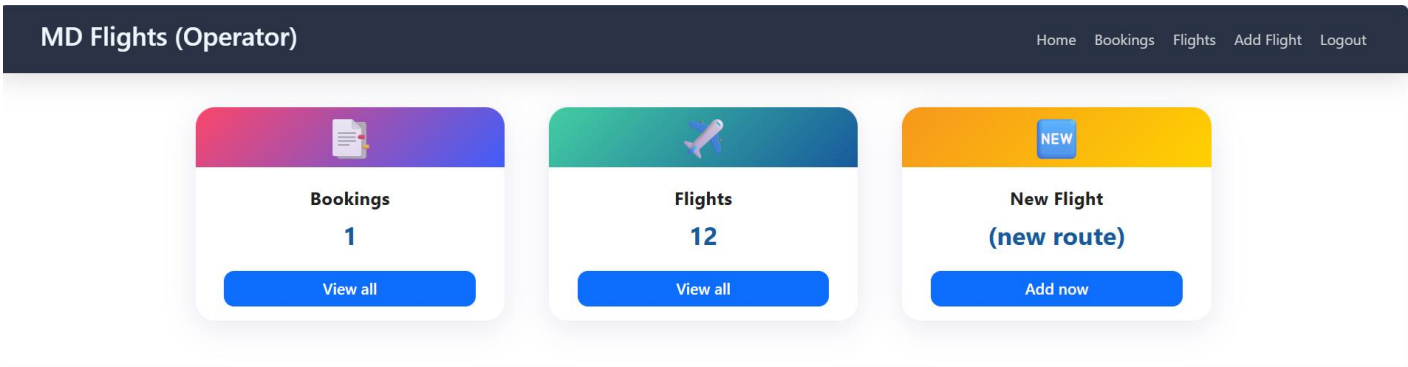

- Admin Dashboard

- All users

- Flight Operator

- **New Flight**

The screenshot shows the 'MD Flights (Operator)' interface with a navigation bar containing 'Home', 'Bookings', 'Flights', 'Add Flight', and 'Logout'. The main content area features a form titled 'Add new Flight' overlaid on a background image of an airplane wing. The form includes the following fields: 'Flight Name' (pre-filled with 'MD FLIGHTS'), 'Flight Id' (empty), 'Departure City' (dropdown menu), 'Departure Time' (datetime picker), 'Destination City' (dropdown menu), 'Arrival time' (datetime picker), 'Total seats' (input field with '0'), and 'Base price' (input field with '0'). A blue 'Add now' button is positioned at the bottom of the form.

- **Book a flight**

The screenshot shows the 'MD Flights' interface with a navigation bar containing 'Home', 'Bookings', and 'Logout'. The main content area features a form titled 'Book ticket' overlaid on a background image of an airplane wing. The form includes the following fields: 'Flight Name' (pre-filled with 'MD FLIGHTS'), 'Flight No' (pre-filled with 'MDF005'), 'Base price: 7500', 'Email' (input field), 'Mobile' (input field), 'No of passengers' (input field with '0'), 'Journey date' (date picker with '30-06-2025'), 'Seat Class' (dropdown menu with 'Select'), and 'Total price: 0'. A blue 'Book now' button is positioned at the bottom of the form.
